

## Chemistry 352/452 – Artificial Intelligence in Chemistry

Welcome to Chemistry 352/452! Artificial intelligence (AI) is rapidly becoming an essential part of modern chemical research. Methods developed in AI and machine learning are now enabling chemists to predict molecular properties, model chemical reactivity, accelerate materials discovery, and gain new insights from simulations and experimental data. From protein structure prediction and catalyst design to automated synthesis planning and spectral interpretation, AI is redefining the questions we can ask and the answers we can obtain (in chemistry).

This course will introduce students to the fundamental concepts of AI and machine learning, with an emphasis on their application to real-world problems in chemistry. Students will study core techniques such as supervised and unsupervised learning, neural networks, and generative models, while gaining hands-on experience applying these methods to tasks like molecular property prediction, reaction outcome modeling, and experimental data analysis. By combining theoretical foundations with practical implementation, the course will prepare students to critically evaluate current research, select and apply appropriate AI methods, and integrate these approaches into their own chemical studies and research.

**Instructors:** Yihang Wang, Ph.D.

**Office:** Millis G27A

**Email:** [yxw2626@case.edu](mailto:yxw2626@case.edu)

**Course Prerequisites:** CHEM 105, CHEM 106, CHEM 111, ENGR 145, MATH 124, and MATH 201, or their equivalents, are recommended.

**Recommended Texts:**

[Deep Learning for Molecules and Materials](#) by Andrew D. White

[Deep Learning](#) by Ian Goodfellow, Yoshua Bengio, and Aaron Courville

[Pattern Recognition and Machine Learning](#) by Christopher M. Bishop

[Machine Learning with PyTorch and Scikit-Learn](#) by Sebastian Raschka

**Learning Objectives:** By the end of this course, students will be able to: (1) explain the fundamental principles of artificial intelligence and machine learning as they apply to chemistry; (2) implement and train basic models using common computational frameworks; (3) apply supervised, unsupervised, and generative methods to problems such as molecular property prediction, reaction outcome modeling, and analysis of chemical data; (4) critically read and evaluate current research literature in AI for chemistry; and (5) develop problem-solving strategies that integrate AI methods into their own chemical studies and research.

**Tentative Topics:**

The course will begin with a review of the essential mathematical and computational foundations for machine learning, including linear algebra, statistics, and optimization. Building on this background, we will explore core machine learning methods relevant to chemistry: featurizing molecular data, unsupervised learning for pattern recognition and dimensionality reduction, and supervised learning for

property and reactivity prediction. We will then examine neural networks in detail, covering both fundamental principles and modern architectures such as convolutional and graph neural networks. Advanced topics will include generative models and large language models, with an emphasis on their application to chemical modeling. The second part of the course will focus on frontier applications, including AI for synthesis planning, protein structure prediction, molecular dynamics and simulation analysis, and the development of machine learning-based force fields.

**Reading assignments (RAs):** Prior to most lectures, a reading assignment will be posted to Canvas. You need to do the reading and complete a short assignment. The use of large language models (LLMs) will be specified in the assignments; all work must reflect your own understanding and effort.

**Homework assignments (HWs):**

Homework assignments will provide hands-on experience with methods. The use of LLMs is not encouraged unless specific. Discussion among classmates is allowed, but each student must complete and submit their own work. Late homework assignments will be accepted up to 72 hours after the due date, with a penalty of 20% per day.

**Final Projects:**

There will be individual projects and team projects with up to three students per team. Further details will be released later.

Students enrolled in CHEM 452 will be required to develop a machine learning project of their choice. Students enrolled in CHEM 352 may participate in a project for bonus credit.

**Grades:**

All in-class quizzes will be counted as bonus credit and added to the final grade.

RAs are graded based on effort, with a maximum of 5 points per assignment. The total number of RAs may change as the course develops. Only the highest six RA scores will be counted toward the final grade. Due by 8:00 AM on the day of the lecture.

HWs consist of five assignments, each worth 100 points. Only the highest four homework scores will be counted toward the final grade. Due by 8:00 AM on the day of the lecture.

Grades will be calculated with the following weighting:

CHEM 352: 40% reading assignment questions, 60% homework assignments, and up to 20% bonus credit for final projects.

CHEM 452: 30% reading assignment questions, 45% homework assignments, and 25% for final projects.

**Academic Honesty:** Students at Case Western Reserve University are expected to uphold the highest ethical standards of academic conduct. Please review the complete [academic integrity policy](#). Any violation of the policy will be reported to the Dean of Undergraduate Studies and the Office of Student Conduct & Community Standards.

**Disabilities:** In accordance with federal law, if you have a documented disability, you may be eligible to request accommodations from Disability Resources. In order to be considered for accommodations, you must first register with the Disability Resources office. Please contact their office to register at [216.368.5230](tel:216.368.5230) or [get more information on how to begin the process](#). Please keep in mind that accommodations are not retroactive.

**Course Schedule:**

| <b>Week</b>   |        | <b>Topic</b>  | <b>Task</b>               |  |
|---------------|--------|---|---------------------------|--|
| <b>Week1</b>  | Jan 12 | Course overview and syllabus<br>Introduction to Python programming                                    |                           |  |
|               | Jan 14 | Mathematical foundations for machine learning<br>Introduction to supervised learning                  | RA1 due                   | RA 1: Mathematical foundations I<br>—matrix inversion                    |
| <b>Week2</b>  | Jan 19 | Supervised learning methods (regression and classification)   | <b>HW1 out</b>            | HW1: Python programming  |
|               | Jan 21 | Introduction to neural networks and backpropagation   | RA2 due                   | RA 2: Mathematical foundations II<br>—gradients and derivatives          |
| <b>Week3</b>  | Jan 26 | Neural network classifiers  | <b>HW2 out</b>            | HW2: First steps with neural networks                                    |
|               | Jan 28 | Unsupervised learning<br>Dimensionality reduction methods   | RA3 due                   | RA 3: Building your first neural network                                 |
| <b>Week4</b>  | Feb 2  | Molecular clustering and similarity analysis  | <b>HW 1 due</b>           |  |
|               | Feb 4  | Unsupervised learning with neural networks<br>representation learning                                 |                           |  |
| <b>Week5</b>  | Feb 9  | Variational Autoencoder   | <b>HW2 due</b>            |  |
|               | Feb 12 | Dimensionality reduction and latent spaces for molecular data   |                           |  |
| <b>Week6</b>  | Feb 16 | Advanced network architectures I:<br>Molecular representations: descriptors, fingerprints, and graphs | <b>HW3 out</b><br>RA4 due | RA 4: Permutation and translation invariance<br>HW3: Deep neural network |
|               | Feb 18 | Multilayer perceptrons (MLPs) and convolutional neural networks (CNNs)                                |                           |  |
| <b>Week7</b>  | Feb 23 | Graph representations of molecules<br>Graph convolution and message passing                           |                           |  |
|               | Feb 25 | Graph Neural Networks (GNNs) for chemistry applications   |                           |  |
| <b>Week8</b>  | Mar 2  | Advanced Network Architectures II:<br>Modeling time series data, RNNs and LSTMs                       | <b>HW3 due</b><br>RA5 due | RA 5: Modeling long sequences and memory                                 |
|               | Mar 4  | Transformers and attention mechanisms   |                           |  |
| <b>Week9</b>  | Mar 9  | Sprig break   |                           |  |
|               | Mar 11 | Sprig break   |                           |  |
| <b>Week10</b> | Mar 16 | Vibe Coding: AI-assisted programming  | Final project topic due   |  |
|               | Mar 18 | Generative AI I: GANs and VAEs  | <b>HW4 out</b>            | HW4: Molecular generation with generative models                         |
| <b>Week11</b> | Mar 23 | Workflow automation tools and AI agents   |                           |  |

|               |        |   |                |   |
|---------------|--------|---|----------------|---|
|               | Mar 25 | Generative AI II: Normalizing flows and diffusion models  | RA6 due        | RA6: Operations on Gaussian distributions   |
| <b>Week12</b> | Mar 30 | Diffusion models with GNNs: Molecular ensemble generation | <b>HW5 out</b> | HW5: Processing and analyzing chemical data |
|               | Apr 1  | Guided diffusion and molecular design                     |                |   |
| <b>Week13</b> | Apr 6  | Predicting protein structure: AlphaFold                   | <b>HW4 due</b> |   |
|               | Apr 8  | Protein large language models, model pretraining          |                |   |
| <b>Week14</b> | Apr 13 | selective topic I   |                |   |
|               | Apr 15 | selective topic II  | <b>HW5 due</b> |   |
| <b>Week15</b> | Apr 20 | Project project Presentations                             |                |   |
|               | Apr 22 | Project project Presentations                             |                |   |
| <b>Week16</b> | Apr 27 | Final project presentations and Q&A                       |                |   |
|               | Apr 29 | Final exam week with no final exam                        |                |   |

**This syllabus is subject to change at the discretion of the instructor. Any modifications will be communicated promptly through Canvas and during class.**
